

A system for end to end brokering of diverse data types

Blake Matheny

March 2003

A L^AT_EX Presentation

Introduction

- ▶ What's the problem space?
- ▶ Is there a solution?
- ▶ Addressing the issues
- ▶ Next generation Intrusion Detection
- ▶ Other Applications

Motivations

- ▶ What is the purpose of a logging mechanism?
 - To relay relevant information to an appropriate agent in the amount of time most suitable for that event.

- ▶ What's wrong with current mechanisms?
 - They don't do this, they relay data to any agent that understands a certain data format and speaks a certain protocol regardless of content

Why is that a problem?

- ▶ Heterogeneous application layer data formats lead to information loss or at best information overload
- ▶ Protocol diversity leads to unusable data
- ▶ Not all data is needed by every agent
- ▶ Makes forensics and correlation difficult or impossible

What does solving these problems give us?

- ▶ Scope resolution for events
- ▶ Better correlation through reduction
- ▶ Better detection by directing higher level events to appropriate systems
- ▶ Detection of unknown attacks through system modeling

What's the solution?

What's the solution?

A system for end to end brokering of diverse data types

Some good ideas

- ▶ Firewall paradigm
 - Network filters are good, so are application filters (content inspection)
 - **The combination is better**
- ▶ Routing paradigm
 - Source routing can be useful
 - How about information routing? (this is where Babe comes in)

Babe architecture

- ▶ Modules
 - Input - Collect data from sources
 - Data Format - Convert ASCII data to an intermediary language or from intermediary language to ASCII
 - Output - Send data to requested destinations

- ▶ Core
 - When new input data is received from an input module, pass it to a format module or process ourselves with FSM
 - Use filters on intermediary language
 - Filters evaluate as boolean expressions
 - Send to one or more output modules, or discard based on rule-set

Addressing the issues

- ▶ Need to model events
- ▶ Language to model high level scenarios
- ▶ Data format transformation is hard
- ▶ Complex systems are vulnerable to SADS (SysAdmin Deficiency Syndrome)

Data Types

- ▶ Data abstraction
- ▶ Three types of data formats
 - Unstructured (NL, free text, etc)
 - Semi-structured (html, syslog)
 - Structured (xml, uml, most programming languages)
- ▶ Most security data formats are either semi-structured or structured
- ▶ We believe that we can model the second two types of data formats, while staying within our requirements, with one common language

Requirements for Transformations

- ▶ Need bijection between original data and intermediary language
 - Must maintain structure
 - Transformation must be lossless
- ▶ Mappings must be user definable
- ▶ Mapping definitions are two-way functions (i.e. $f(x) = y$ and $f(y) = x$)

Event Modeling

- ▶ Allen's Temporal Algebra
 - Temporal relations between events
- ▶ McCarthy's Situational Calculus
 - Causal relations between events

What's right with current Intrusion Detection Systems?

- ▶ They gather lots of information
- ▶ Sometimes they actually detect intrusion attempts
- ▶ Some of them sort of do anomaly detection
- ▶ A couple of them are open source
- ▶ more...

What's wrong with current Intrusion Detection Systems?

- ▶ They gather lots of information
- ▶ Primitive
- ▶ Deal with mostly homogenous sources of information
- ▶ Anomaly detection isn't
- ▶ False positives lead to habituation in system admins
- ▶ The knowledge that a system administrator has often isn't taken into account
- ▶ much more...

How this system fits in

- ▶ Reduce and correlate events
- ▶ Send primitive and aggregate events to systems that can use them
- ▶ Detection of unknown attacks through system modeling
- ▶ Take event information from multiple events for better detection
- ▶ more..

Where do things stand?

- ▶ What's done?
 - We have a prototype system that does:
 - ◆ We do data proxying (smtp->smtp)
 - ◆ We can do network filtering (if source == x send to y)
 - We've mostly worked out the details for our event logic
- ▶ What's not done?
 - Transformations
 - Lots more

What's up with the transformations?

- ▶ We found a solution!
- ▶ We threw that solution in the trash
- ▶ Currently investigating FST
 - AT&T has done some interesting work, as has Xerox
 - Looks good, operates as a two way 'function'

Research 'opportunities' for budding scientists

- ▶ Compiler design
- ▶ Mathematical modeling of attacks
- ▶ Ontological systems and their role in NLP and NLG
- ▶ Data mining
- ▶ Digital Libraries
