1 Introduction

This vignette was created as a tutorial for the 2007 BioConductor User's Conference held in Seattle, WA, USA during August 2007, and was presented by Dr. Warnes and Dr. Lazarus. The material is structured as a tutorial with a small example data set (8184 Markers x 180 Subjects belonging to 50 Families) .

2 Outline

1. Preliminaries
   (a) Install the necessary packages
   (b) Load the libraries
2. Loading Data
   (a) Read data from files
   (b) Error check the loaded data
3. Descriptive Statistics
   (a) Summary of allele/genotyope frequency
   (b) HWE test
   (c) Visualize Disequilbrium
4. Hypothesis Testing
   (a) Armitage test
   (b) Logistic with synthetic covariates
   (c) GLM with synthetic covariates & outcome
5. Subsetting Results and Formatting Output
   (a) Construct some output tables for top 100 significant markers
6. Study planning tools (power, sample size)

3 Preliminaries

3.1 Install RGenetics packages and depenedencies

For MS-Windows it is necessary to manually install dependencies from CRAN

```
> install.packages(c("xtable", "combinat", "gdata", "gplots", "mvtnorm"),
+     dep = TRUE)
```

Now to install the necessary packages:

```
> repos <- c("http://www.warnes.net/bioc2007/", "http://cran.fhcrc.org")
> install.packages(c("GeneticsBase", "GeneticsDesign", "fbat"), repos = repos,
+     type = "source", dep = TRUE)
```

3.2 Load the libraries

```
> library(GeneticsBase)
> library(GeneticsDesign)
> library(fbat)
```

4 Loading Data

4.1 Read data from files

Load the full data:

```
> hm.a <- readGenes(gfile = "hmCEU_YRI_chr22_ALLfbat.ped", gformat = "fbat")

Reading 8184 markers and 180 subjects from ` hmCEU_YRI_chr22_ALLfbat.ped ' ...
generating 'geneSet' object...

100 200 300 400 500 600 700 800 900 1000

7100 7200 7300 7400 7500 7600 7700 7800 7900 8000
8100 Successfully read the pedigree file ` hmCEU_YRI_chr22_Foundersfbat.ped '.
```

```
Number of Markers:  8184
Number of Subjects: 120
Number of Families: 50
```

For the purpose of speeding execution of examples, we'll also create a smaller subset of 100 markers from the original file.

```
> hm.a2 <- hm.a[1:100, ]
```

4.2 Error check the loaded data

Count frequencies of missing genotypes (requires 26 seconds on my MacBook Pro)

Number of missing genotypes per subject:

```
> mG <- missGFreq(hm.a2, founderOnly = TRUE, quiet = FALSE)
```

```
converting geneSet object to numerical matrix...
counting frequencies of missing genotypes...
```

```
> head(mG$nMissSubjects)
```

```
         00 0* *0
subject2  3  0  0
subject3  2  0  0
subject4  4  0  0
subject5  0  0  0
subject8  1  0  0
subject9  3  0  0
```

Column headers:

00 missing both alleles

0* 1st allele missing while the 2nd allele is not missing

*0 1st allele is not missing while the 2nd allele is missing

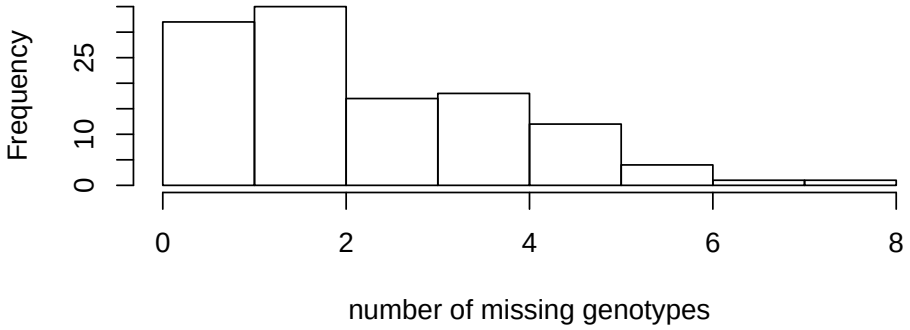
Number of missing genotypes per marker:

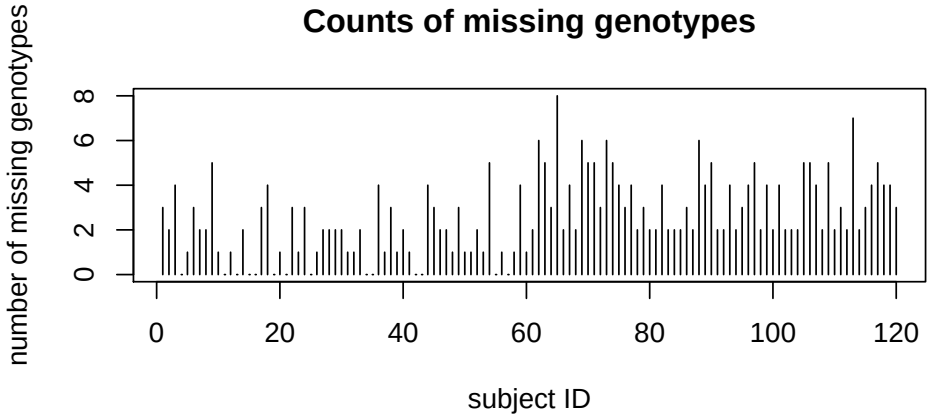
```
> head(mG$nMissMarkers)
```

```
                      00 0* *0
22_14884399_rs4911642 13  0  0
22_15298335_rs2027653  1  0  0
22_15412698_rs5747620  0  0  0
22_15434720_rs9605903  0  0  0
22_15447504_rs5747968  0  0  0
22_15452483_rs2236639  0  0  0
```

Plot counts of missing genotypes:

```
> par(mfrow = c(2, 1))
> hist(mG$nMissSubjects[, 1], main = "", xlab = "number of missing genotypes")
> plot(1:nrow(mG$nMissSubjects), mG$nMissSubjects[, 1], xlab = "subject ID",
+     ylab = "number of missing genotypes", type = "h")
> title("Counts of missing genotypes")
> par(mfrow = c(1, 1))
```





5 Descriptive Statistics

1. Summary of allele/genotyope frequency
2. HWE test
3. Visualize Disequilbrium

Basic data quality checks for markers. Column headings are:

ObsHET observed proportion of heterozygous genotypes per marker

PredHET predicted proportion of heterozygous genotypes per marker

HWpval pvalues of Hardy-Weinberg test per marker

pGeno percentage of non-missing genotypes for markes

MAF minor allele frequencies. missing allele are excluded from calculation

Rating 1 if passes HW test; 0 if failed HW test.

```
> cM <- checkMarkers(hm.a2)
> head(cM)

22_15452483_rs2236639 100.00000 0.0625000      0
```

Check Mendelian errors:

```
> cMend <- checkMendelian(hm.a2, quiet = FALSE)

converting geneSet object to numerical matrix...
checking Mendelian errors ...
checking compatibility ...
```

Number of Mendelian errors per marker:

```
> head(cMend$nMerrMarker)

22_14884399_rs4911642 22_15298335_rs2027653 22_15412698_rs5747620 22_15434720_rs9605903
                    8                     1                     0                     0
22_15447504_rs5747968 22_15452483_rs2236639
                    0                     0
```

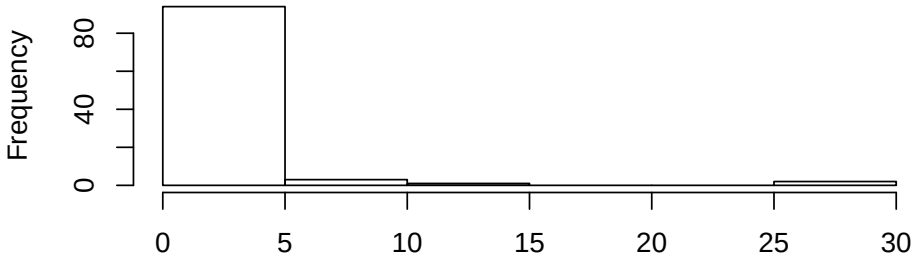
Number of Mendelian errors per family:

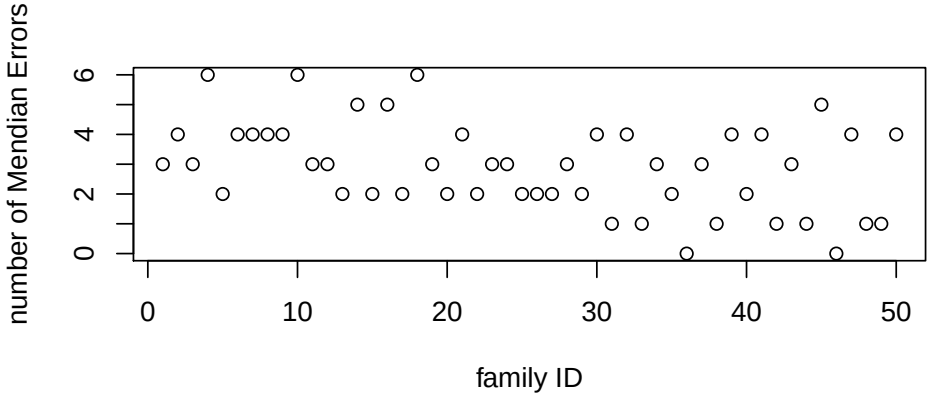
```
> head(cMend$nMerrFamily)

family1 family2 family3 family4 family5 family6
      3       4       3       6       2       4
```

Plot counts of Mendelian errors

```
> par(mfrow = c(2, 1))
> hist(cMend$nMerrMarker, main = "", xlab = "number of Mendelian errors")
> plot(1:length(cMend$nMerrFamily), cMend$nMerrFamily, xlab = "family ID",
+     ylab = "number of Mendian Errors")
> par(mfrow = c(1, 1))
```





5.1 Summary of allele/genotype frequency based on GeneticsBase functions

Allele summary, including allele counts, allele frequencies, 95% CI of allele frequencies:

```
> t1 <- alleleSummary(hm.a2[1:10])
> t1
```

Gene	Marker	Position	Group	Allele	Count	Freq	CI-Lower	CI-Upper

Footer:
          Confidence intervals width is 95%, computed using
          the exact quantiles for the binomial
          distribution. As the true distribution is
          multinomial this is only approximately correct.
```

HWE test:

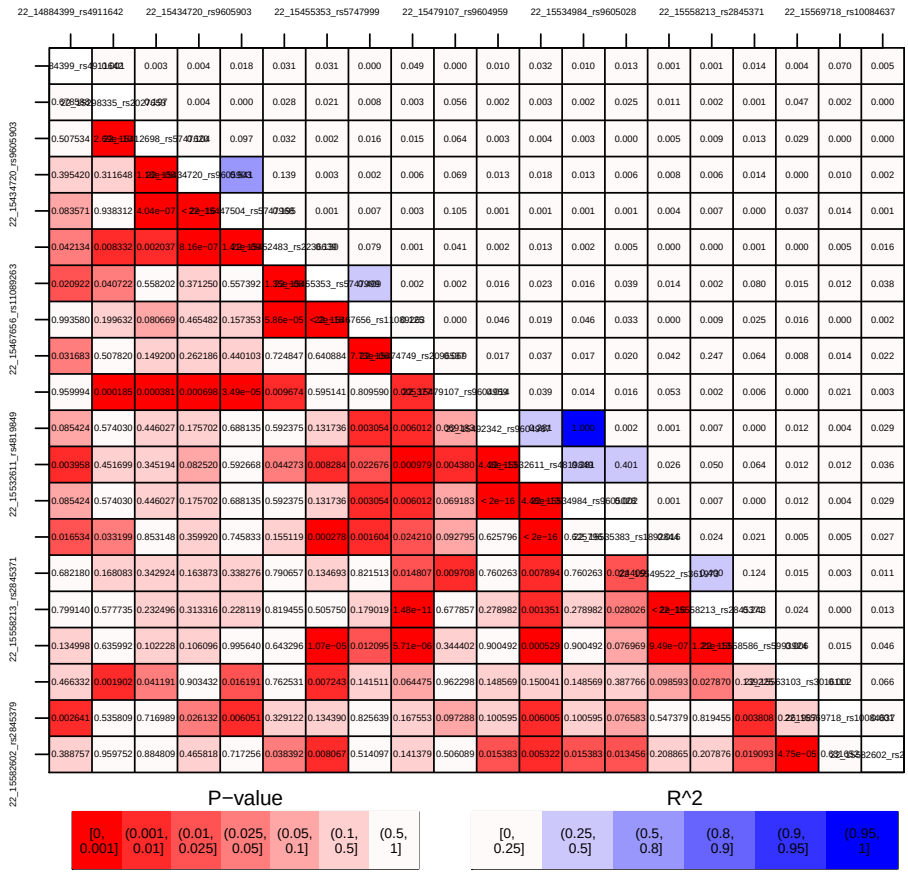
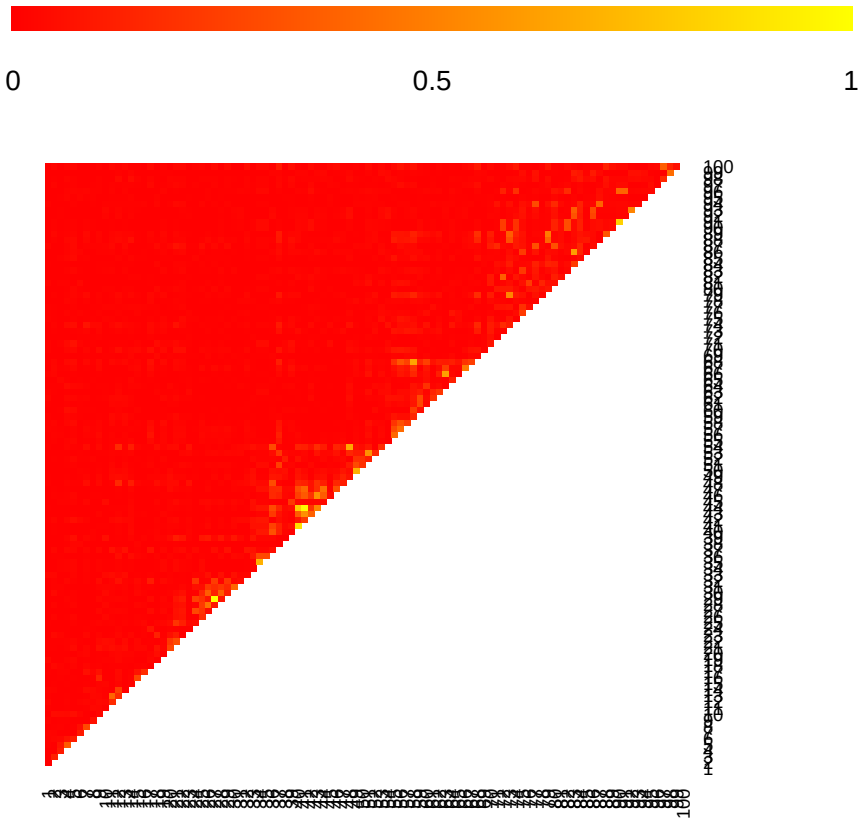
Defatult graphical display of LD:

```
> ld.small <- LD(hm.a2[1:20])
> plot(ld.small)
```



Alternative graphical display of LD:

```
> ld <- LD(hm.a2)
> LDView(ld@"X^2")
```



6 Hypothesis Testing

6.1 Armitage test

For the following examples, suppose 'A' is the minor allele, and 'a' is the major allele.

Armitage test using additive model to code genotype:

genotype	coding
AA	2
Aa	1
aa	0

```
> res.A <- Armitage(hm.a2, method = "A")
> head(res.A)
```

```
                           stat       pvalue
22_14884399_rs4911642  4.38726430 3.620837e-02
22_15298335_rs2027653  8.62689991 3.312348e-03
22_15412698_rs5747620  0.01107079 9.162030e-01
22_15434720_rs9605903 34.00571358 5.495048e-09
22_15447504_rs5747968 35.11899027 3.101613e-09
22_15452483_rs2236639  2.43861135 1.183810e-01
```

Armitage test using recessive model to code genotype:

genotype	coding
AA	1
Aa	0
aa	0

```
> res.R <- Armitage(hm.a2, method = "R")
> head(res.R)
```

```
                           stat      pvalue
22_14884399_rs4911642        NA          NA
22_15298335_rs2027653 1.6258677 0.202275552
22_15412698_rs5747620 0.1285714 0.719917853
22_15434720_rs9605903 6.2068966 0.012725353
22_15447504_rs5747968 9.4736842 0.002084403
22_15452483_rs2236639 0.0000000 1.000000000
```

Armitage test using dominant model to code genotype:

genotype	coding
AA	1
Aa	1
aa	0

```
> res.D <- Armitage(hm.a2, method = "D")
> head(res.D)
```

```
                            stat       pvalue
22_14884399_rs4911642  4.3872643 3.620837e-02
22_15298335_rs2027653 10.0936094 1.487844e-03
22_15412698_rs5747620  0.2462380 6.197365e-01
22_15434720_rs9605903 37.0478170 1.152676e-09
22_15447504_rs5747968 35.8892308 2.088600e-09
22_15452483_rs2236639  3.0769231 7.941063e-02
```

6.2 Logistic regression

First, we need to construct some synthetic covariates on the founders

```
> sampleInfo(hm.f)$race <- sampleInfo(hm.f)$affected
> raceval <- sampleInfo(hm.f)$race - 1
> sampleInfo(hm.f)$Norm0.0 <- rnorm(nobs(hm.f), mean = 0 * raceval)
> sampleInfo(hm.f)$Norm0.5 <- rnorm(nobs(hm.f), mean = 0.5 * raceval)
> sampleInfo(hm.f)$Norm1.0 <- rnorm(nobs(hm.f), mean = 1 * raceval)
> sampleInfo(hm.f)$Norm1.5 <- rnorm(nobs(hm.f), mean = 1.5 * sampleInfo(hm.f)$race)
> doSample <- function(raceval, mult) {
+     prob <- c(0.33 - raceval * mult, 0.33 + (raceval * mult)/2, 0.33 +
+         (raceval * mult)/2)
+     factor(sample(x = c("Red", "Green", "Blue"), size = 1, p = prob,
+         rep = T))
+ }
> sampleInfo(hm.f)$Cat0.0 <- sapply(raceval, doSample, mult = 0)
> sampleInfo(hm.f)$Cat0.1 <- sapply(raceval, doSample, mult = 0.1)
> sampleInfo(hm.f)$Cat0.2 <- sapply(raceval, doSample, mult = 0.2)
> sampleInfo(hm.f)$Cat0.3 <- sapply(raceval, doSample, mult = 0.3)
```

Now, construct a function to fit the regression model and return the parameters and statistics that are of interest.

```
model <- function( markerName )
  {
    # extract requested genetic marker
    genotype <- genotypes(hm.f,marker=markerName)

    # get data frame to use for fitting the model
    mframe <- model.frame(race ~ sex + Norm0.0 + Norm0.5 + Norm1.0 + Norm1.5 + genotype,
                          data=sampleInfo(hm.f) )

    # To test significance of a term, best method is to do anova of
    # the full model against a submodel omitting the particular term.
    # This avoids issues with changes in names of factor levels,
    # presence or absence of covaraiates, etc.
    result <- try(
                  {
  fit.with    <- glm( race==1 ~ sex + Norm0.0 + Norm0.5 + Norm1.0 + Norm1.5 + as.factor(genotype),
                      data=mframe, family="binomial")
  fit.without <- glm( race==1 ~ sex + Norm0.0 + Norm0.5 + Norm1.0 + Norm1.5,
                      data=mframe, family="binomial")
                     anova(fit.with, fit.without, test="Chisq")$"P(>|Chi|)"[2]
                  }
                  )

    if(class(result)=="try-error")
      return(NA)  # or return(result) to see the error messages
    else

      result # full result.  Usually we want to specify exactly which
             # parameters and stats get returned so the format is consistent
             # across all markers.
  }
```

```
> model <- function(markerName) {
+     genotype <- genotypes(hm.f, marker = markerName)
+     mframe <- model.frame(race ~ sex + Norm0.0 + Norm0.5 + Norm1.0 +
+         Norm1.5 + genotype, data = sampleInfo(hm.f))
+     result <- try({
+         fit.with <- glm(race == 1 ~ sex + Norm0.0 + Norm0.5 + Norm1.0 +
+             Norm1.5 + as.factor(genotype), data = mframe, family = "binomial")
+         fit.without <- glm(race == 1 ~ sex + Norm0.0 + Norm0.5 + Norm1.0 +
+             Norm1.5, data = mframe, family = "binomial")
+         anova(fit.with, fit.without, test = "Chisq")$"P(>|Chi|)"[2]
+     })
+     if (class(result) == "try-error")
+         return(NA)
+     else result
+ }
```

Fit to a subset of 50, then 100 and use this information to compute the expected run time for all markers:

```
> t1 <- unix.time(fits <- sapply(markerNames(hm.f)[1:50], model))[3]
> t1
```

```
elapsed
  5.082
```

(This takes 5.365 seconds on my MacBook Pro, R 2.4.1)

```
> t2 <- unix.time(fits <- sapply(markerNames(hm.f)[1:100], model))[3]
> t2

elapsed
 10.202
```

(This takes 11.878 seconds on my MacBook Pro, R 2.4.1)

Estimate total time to complete, in minutes

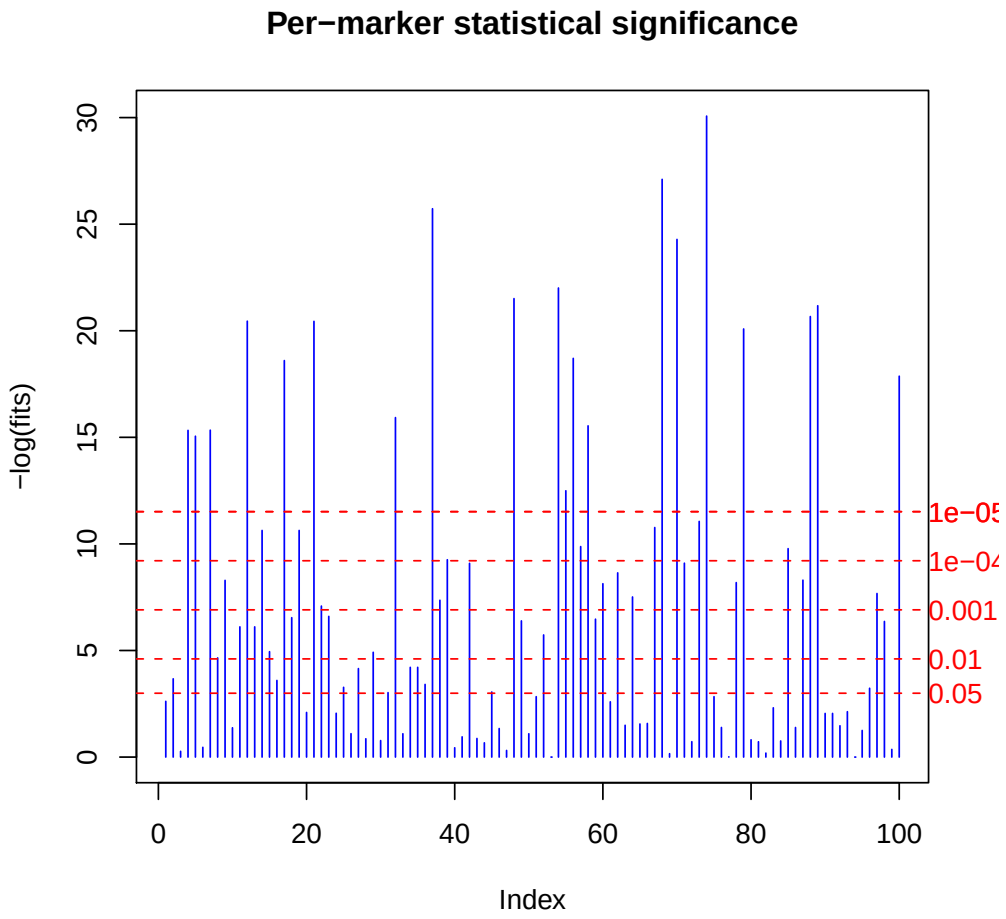
```
> t1 + (t2 - t1)/50 * (nmarker(hm.f) - 50)/60

 elapsed
18.96403
```

(This yields 23.02 minutes on my MacBook Pro, R 2.4.1)

Plot the p-values for the first 100 markers

```
> fits.sorted <- sort(fits)
> plot(-log(fits), type = "h", col = "blue")
> labels <- c(0.05, 0.01, 0.001, 1e-04, 1e-05, 1e-05)
> abline(h = -log(labels), lty = 2, col = "red")
> mtext(text = as.character(labels), side = 4, at = -log(labels), col = "red",
+     las = 1)
> title("Per-marker statistical significance")
```



6.3 Family-Based Associaton Test ('fbat')

Do the fbat calculations:

```
> f <- fbat(hm.a2)
```

Show the p-values:

```
> summaryPvalue(f)
```

```

7 Study planning tools (GeneticsDesign package)

7.1 Power to detect a low-frequencty allele

Compute the probability of missing an allele with frequency 0.15 when 20 genotypes are sampled:

```
> gregorius(freq = 0.15, N = 20)

$call
gregorius(freq = 0.15, N = 20)

$method
[1] "Compute missprob given N and freq"

$freq
[1] 0.15

$N
[1] 20

$missprob
[1] 0.1938351
```

Determine what sample size is required to observe all alleles with true frequency 0.15 with probability 0.95

```
> gregorius(freq = 0.15, missprob = 1 - 0.95)

$call
gregorius(freq = 0.15, missprob = 1 - 0.95)

$method
[1] "Determine minimal N given missprob and freq"

$freq
[1] 0.15

$N
```

```
[1] 29

$missprob
[1] 0.04520557
```

7.2 Power for a genetics study using a quantitative outcome

Calculate power for genetics study using a quantitative outcome:

```
> GeneticPower.Quantitative.Numeric(N = 50, freq = 0.1, minh = "recessive",
+     alpha = 0.05)

[1] 0.0600883

> GeneticPower.Quantitative.Factor(N = 50, freq = 0.1, minh = "recessive",
+     alpha = 0.05)

[1] 0.08666032
```

For a range of sample sizes:

```
> power.range <- function(N, ...) {
+     sapply(N, function(n) GeneticPower.Quantitative.Numeric(N = n, ...))
+ }
> power.range(N = c(25, 50, 100, 200, 500), freq = 0.1, minh = "recessive",
+     alpha = 0.05)

[1] 0.05492509 0.06008830 0.07049383 0.09160716 0.15665828
```

Create a power table:

```
> fun <- function(p) power.range(freq = p, N = seq(100, 1000, by = 100),
+     alpha = 0.05, minh = "recessive")
> m <- sapply(X = seq(0.1, 0.9, by = 0.1), fun)
> colnames(m) <- seq(0.1, 0.9, by = 0.1)
> rownames(m) <- seq(100, 1000, by = 100)
> print(round(m, 2))

     0.1  0.2  0.3  0.4  0.5  0.6  0.7  0.8  0.9
100  0.07 0.20 0.47 0.76 0.93 0.98 0.99 0.99 0.97
200  0.09 0.35 0.77 0.97 1.00 1.00 1.00 1.00 1.00
300  0.11 0.49 0.91 1.00 1.00 1.00 1.00 1.00 1.00
400  0.13 0.61 0.97 1.00 1.00 1.00 1.00 1.00 1.00
500  0.16 0.70 0.99 1.00 1.00 1.00 1.00 1.00 1.00
600  0.18 0.78 1.00 1.00 1.00 1.00 1.00 1.00 1.00
700  0.20 0.84 1.00 1.00 1.00 1.00 1.00 1.00 1.00
800  0.22 0.88 1.00 1.00 1.00 1.00 1.00 1.00 1.00
900  0.24 0.92 1.00 1.00 1.00 1.00 1.00 1.00 1.00
1000 0.27 0.94 1.00 1.00 1.00 1.00 1.00 1.00 1.00
```

7.3 Power calculator for genetic linear trend association studies.

The power is for the test that disease is associated with a marker, given high risk allele frequency ('A'), disease prevalence, genotype relative risk ('Aa'), genotype relative risk ('AA'), LD measure (D' or R^2), marker allele frequency ('B'), number of cases, control:case ratio, and probability of the Type I error. The linear trend test (Cochran 1954; Armitage 1955) is used.

Using R^2 as the measuer of LD:

```
> res1 <- GPC(pA = 0.05, pD = 0.1, RRAa = 1.414, RRAA = 2, r2 = 0.9, pB = 0.06,
+     nCase = 500, ratio = 1, alpha = 0.05, quiet = FALSE)

 Case-control parameters>>
                                        [,1]
Number of cases                  500.00000000
Number of controls               500.00000000
High risk allele frequency (A)     0.05000000
